

Manuels Gold

Strategic Low-Sulphidation Epithermal Gold Property

- ★ Located along a major gold trend, potential to host a significant low-sulphidation epithermal gold system.
- ★ 3km south of Conception Bay South, accessible via gravel road.
- ★ Strategically positioned north and east of Trinity Resources' open pit pyrophyllite mine.
- ★ Geology indicative of a shallowly eroded, volcanic hosted, low-sulphidation epithermal Au-Ag mineral system.
- ★ Property is in good standing with nearly \$500,000 spent including on geochemistry and diamond drilling in 2020-2021.

Nearby Prospects (same geological trend runs through Manuels Gold property)

- ★ **Berg's Prospect:** Bonanza grade gold (up to 54.3 g/t) found in 1m wide quartz-hematite vein samples. Multiple veins trend N/S, dipping moderately to steeply east.
- ★ **Steep Nap Prospect:** 1 km vein/breccia with gold samples up to 9.3 g/t. NW/SE trend, eastward moderate to steep dip. Channel samples show 0.39 g/t gold over 18.5m, peaking at 4.7 g/t over 0.25m. Drilling revealed breccia zones and quartz-adularia veins with gold up to 1.2 g/t over 1.6m and 1.94 g/t over 0.7m.
